

Airvenue BA200

The BA200 is a four-radio, wireless internetworking platform that can be used to build large-scale WiFi networks from single, private buildings to carrier grade, city-wide metro networks.

Encased in a compact, environmentally hardened outdoor package, and available in multiple configurations, the BA200 is designed to be deployed outdoors to provide WiFi coverage in nearby buildings or over large outdoor areas. It can be used as a standalone device, or as part of the Airvenue multiple point-to-point wireless mesh.

The BA200 is the key building block of the Airvenue cellular LAN architecture.

As part of the complete Airvenue wireless networking solution, the BA200 allows network operators to quickly and easily build networks for public Internet access applications such as:

- E-mail
- Web surfing
- Instant messaging
- Corporate VPN access

It can also be used for closed and private wireless applications such as:

- Corporate VPNs
- Office file and print sharing
- Security and surveillance
- Operations messaging and tracking
- File sharing for police, health, fire, and other emergency response units
